ISSUE NO. 1

Approval Flow does not Take Effect if Updated

PRODUCT Lotus

MODULE Disciplinary Action

CORE FUNCTION NaveeWorkforce

ROOT CAUSE ANALYSIS

§1 ISSUE

Approval flow does not take effect when the approval flow setup is updated after a Disciplinary Action record has already been created.

PRODUCT

Lotus

MODULE

Disciplinary Action

CORE FUNCTION

NaveeWorkforce

§2 ROOT CAUSE

The root cause of this issue was a fundamental flaw in how the system managed approval workflow configurations. Specifically, the approval workflow configuration was initialized only during record creation and was never refreshed when the Approval Flow Setup was subsequently updated. This meant that existing Disciplinary Action records continued to operate with outdated approval rules, even after the approval flow setup was changed. When an approver attempted to access such a record, the Approval API returned HTTP 500 (an internal server error) because the `approver\_id` was missing from the request payload. Further investigation of server logs revealed a `NullReferenceException` (an error when a program tries to use an object that hasn't been created) in `ApprovalFlowService.GetCurrentApprover()`

at line 142. This indicated that the `ApprovalFlowService` component failed to correctly retrieve the current approver due to the stale configuration, preventing the "Approve" and "Reject" buttons from being displayed correctly.

§3 AFFECTED MODULE

The issue primarily affected the following components and modules: * **Disciplinary Action** module: This is the primary module within the **NaveeWorkforce** core function where the outdated approval configurations prevented proper workflow execution. * **ApprovalFlowService**: This specific service component was directly impacted, particularly the `ApprovalFlowService.GetCurrentApprover()` method at `line 142`, which failed due to a `NullReferenceException` when attempting to retrieve approver information from stale configurations. * **Approval Flow** system: The overall approval workflow configuration and its refresh mechanism were at fault, as the configuration was "initialized only during record creation" and "never refreshed when Approval Flow Setup is subsequently updated."

§4 IMPACT ANALYSIS

Not specified.

QUALITY GATE — FIRST PASS Passed	SMOKE TEST — FIRST PASS Passed	REOPEN COUNT 0
FC FAILED TESTING 0	QA STATUS Passed	QA VALIDATED BY Joan Marie Piñeda

§6 CORRECTIVE ACTION

The corrective action implemented addresses the issue where approval flows were not taking effect after updates. Specifically, approval flow refresh logic was added to the `ApprovalFlowService`. This technical change ensures that existing Disciplinary Action records now reload the latest approval configuration on access when a setup change is detected. This means that if an approval workflow configuration is updated, any existing Disciplinary Action records will correctly reflect the new approval steps, rather than using outdated settings. The fix was verified by QA, who confirmed that the Approve and Reject buttons are now displayed correctly for existing Disciplinary Action records after an Approval Flow Setup update. The changes were implemented by Developer Jomar Talambayan and can be reviewed in Pull Request <https://github.com/TechIgnite-Business-Solutions-Inc/rnd-rca-gen/pull/1> on the `fix/approval-flow-refresh` branch.

§7 PREVENTIVE ACTION

Not specified.
